

Custom medications can provide relief and enhance quality of life for patients with urological problems.

Erectile dysfunction, bladder problems, low testosterone, and cancer are just a few of the urological problems that can affect a patient's overall health. Wells Pharmacy prepares safe, high quality compounded solutions that address the patient's specific needs and help to enhance their quality of life.

Anastrozole – a potent aromatase inhibitor that suppresses or blocks the conversion pathway from testosterone to estrogen, thereby reducing the breakdown of testosterone into estrogens.

Bimix – combination of potent vasodilators (papaverine and phentolamine) for the treatment of erectile dysfunction and impotence.

Estriol, Estradiol, Testosterone – singular or combination hormone creams, gels and inserts prescribed for female patients experiencing vaginal atrophic changes.

hCG (Human Chorionic Gonadotropin) – used to stimulate testicular production of testosterone in a hypogonadal male as well as to prevent testicular atrophy with concomitant use of exogenous testosterone replacement therapy.

DMSO/Lidocaine – a sterile irrigation treatment used for interstitial cystitis in the bladder.

Lidocaine HCl/Methylcellulose Jelly – anesthetic used in urological procedures.

Mitomycin – lyophilized chemotherapeutic agent used as an irrigation (intravesicular) treatment for bladder cancer.

Quadcaine – topical anesthetic used for premature ejaculation and persistent genital arousal disorder.

Testosterone creams or pellets – for hormone replacement therapy.

Testosterone Cypionate, Enanthate or Propionate injectables – for hormone replacement therapy.

Trimix – combination of potent vasodilators (papaverine, phentolamine) and a prostaglandin (alprostadil) for the treatment of erectile dysfunction and impotence.

Ultra-Test – combination of testosterone cypionate and testosterone propionate.
